- Transitive closure of a directed graph

Using SSSP algorithms

• We can solve an all-pairs shortest-paths problem by running a *single-source shortest-paths algorithm* |V| *times*, once for each vertex as the source.

Nonnegative-weight edges

- Dijkstra's algorithm
 - The linear-array implementation
 - $O(V \cdot V^2) = O(V^3)$.
 - The binary min-heap implementation
 - $O(V \cdot (V \lg V + E \lg V)) = O(V^2 \lg V + V E \lg V)$

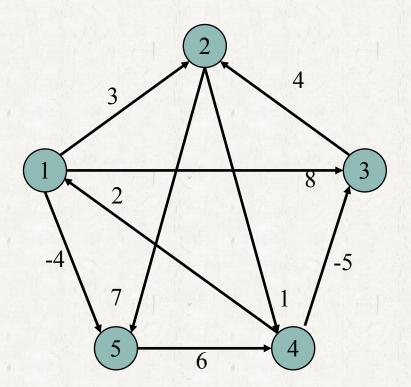

Using SSSP algorithms

- Negative-weight edges
 - Bellman-Ford algorithm
 - $O(V \cdot VE) = O(V^2E)$
 - $O(V^4)$ on a dense graph

Intermediate Vertex

• An intermediate vertex of a simple path $p = \langle v_1, v_2, \dots, v_l \rangle$ is any vertex of p from v_2 to v_{l-1} .

• The structure of a shortest path

- Floyd-Warshall algorithm is based on the observation of the intermediate vertices, which costs $\Theta(V^3)$ time.
- Let $V = \{1, 2, \dots, n\}$.
- For any pair of vertices $i, j \in V$, consider all paths from i to j whose intermediate vertices are all drawn from $\{1, 2, \dots, k\}$, and let p be a minimum weight path from among them.

- If k is not an intermediate vertex of path p, then all intermediate vertices of p are in $\{1, 2, \dots, k-1\}$.
- If k is an intermediate vertex of path p, then we break p down into $i \stackrel{p_1}{\leadsto} k \stackrel{p_2}{\leadsto} j$.

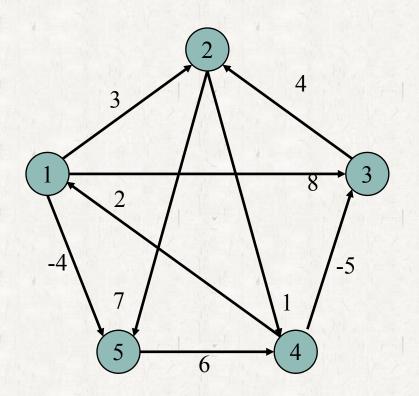

- A recursive solution to the all-pairs shortest-paths problem
 - Let $d_{ij}^{(k)}$ be the weight of a shortest path from vertex i to vertex j for which all intermediate vertices are in the set $\{1, 2, \dots, k\}$.
 - We have the following recurrence:

$$d_{ij}^{(k)} = \begin{cases} w_{ij} & \text{if } k = 0, \\ \min(d_{ij}^{(k-1)}, d_{ik}^{(k-1)} + d_{kj}^{(k-1)}) & \text{if } k \ge 1. \end{cases}$$
 (25.5)

• Because for any path, all intermediate vertices are in the set $\{1, 2, \dots, n\}$, the matrix $D^{(n)} = d_{ij}^{(n)}$ gives the final answer: $d_{ij}^{(n)} = \partial(i, j)$ for all $i, j \in V$.

```
FLOYD-WARSHALL(W)
    n \leftarrow rows[\mathbf{W}]
2 \mathbf{D}^{(0)} \leftarrow \mathbf{W}
    for k \leftarrow 1 to n
           do for i \leftarrow 1 to n
                       do for j \leftarrow 1 to n
                                   do d_{ii}^{(k)} \leftarrow \min(d_{ii}^{(k-1)}, d_{ik}^{(k-1)} + d_{ki}^{(k-1)})
7 return \mathbf{D}^{(n)}
```

 \circ costs $\Theta(n^3)$ time.
